## 4 Sponsor Sessions at 11:40

Don't miss them, they might be getting distributing some awesome prizes!

- HPE
- SolidQ
- KABEL
- TSD Consulting

Also **BIG Raffle prizes** at the end of the event provided by:

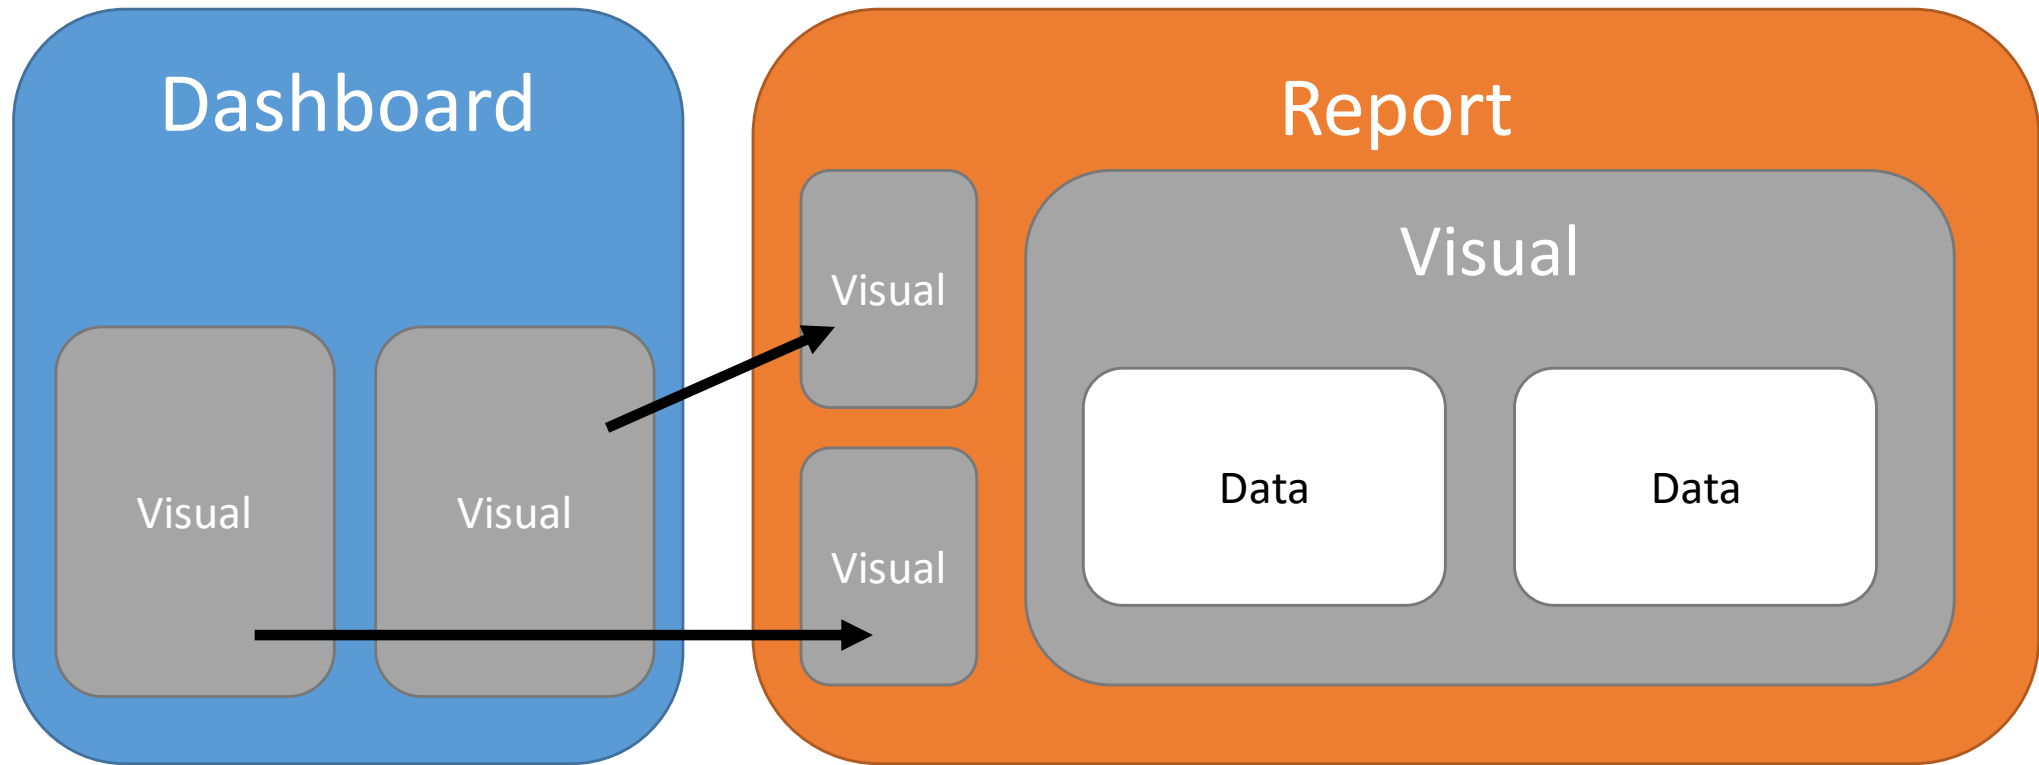

Plainconcepts, SolidQ, Kabel, TSD Consulting,  
Pyramid Analytics & sqlpass.es

# Agenda

Intro to visuals  
Why it is a good idea !  
Getting custom visual  
Setting up Environment  
Visual lifecycle  
Data binding  
Building Bar Chart  
Formatting

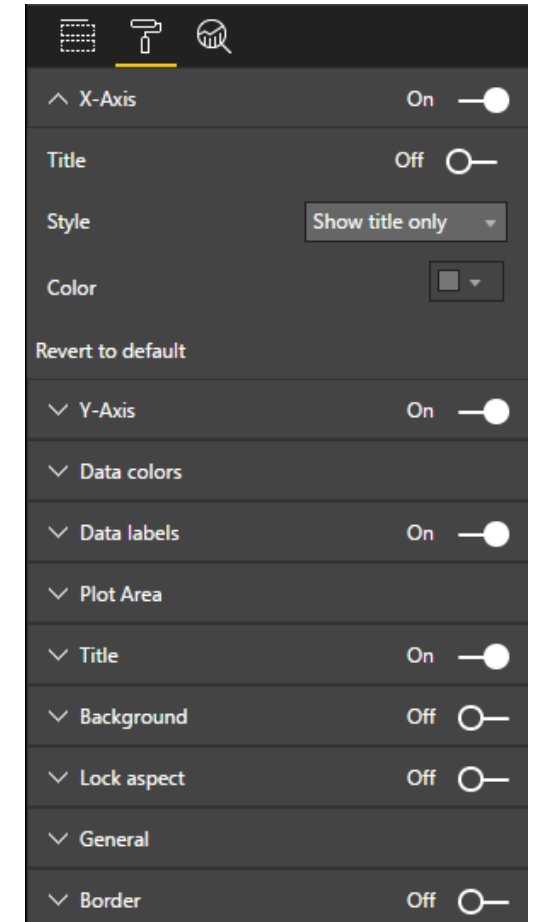

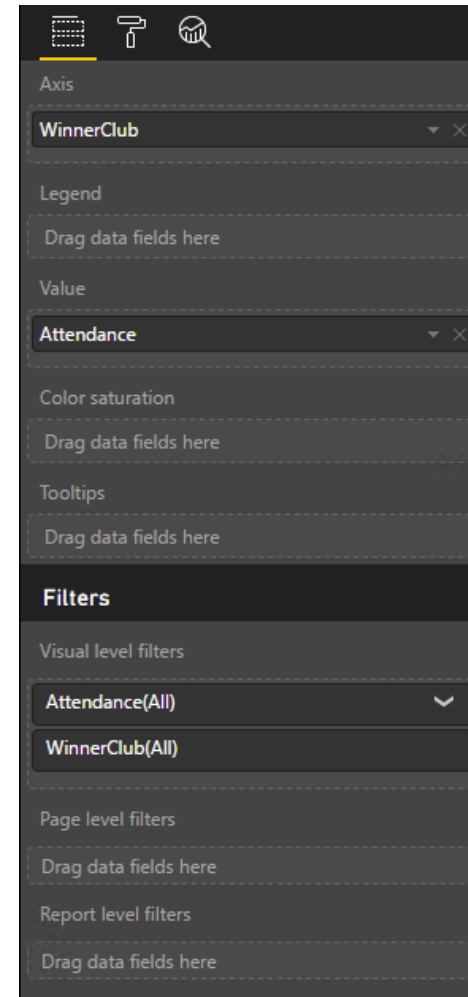

Power BI contains dashboards, reports, visuals and data

# Visual Show info, allow interaction and provide insights

- Some types are bar charts, pie charts, maps, tables...
- Switch between types
- Modify the data and properties the visual uses

# Make your own

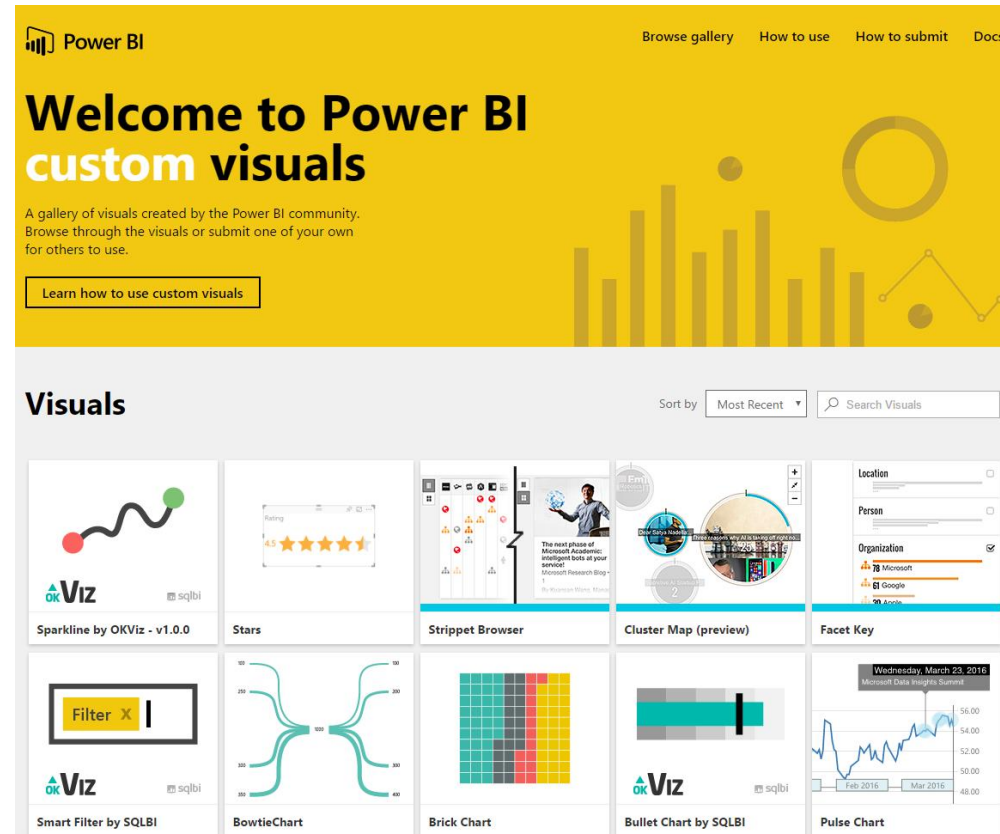

- Microsoft open sourced the code for visuals
- You can use them in own reports and dashboards
- You can submit your visuals for inclusion in Power BI for others

# Getting Custom Visuals

Available at the Power BI custom visuals gallery

<http://app.powerbi.com/visuals>

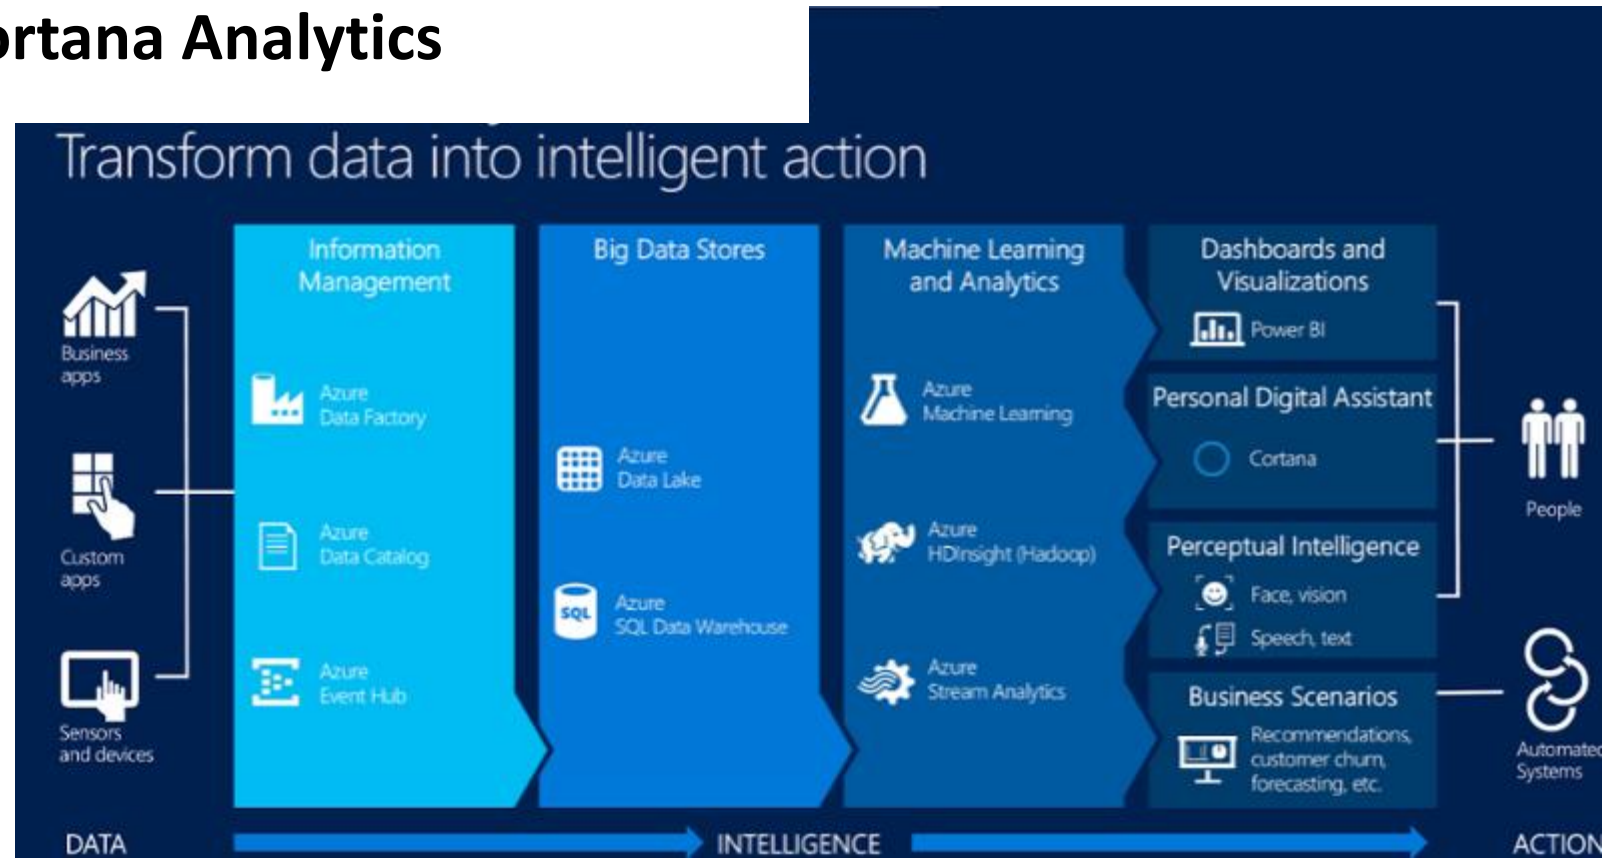

# Is it a good idea ?

Separates Power BI from the Competition

**Empowers Users Through the Gallery**

Energizes the Power BI Development Community

**Reflects Favorably on Cortana Analytics**

# Setting up the environment – old API

Install Node.js

Install gulp if not present: `npm install -g gulp`

Clone a copy of the repo:

```
git clone https://github.com/Microsoft/PowerBI-visuals-core.git
```

Change to the PowerBI-visuals-core directory:

```
cd PowerBI-visuals-core
```

Install dev dependencies:

```
npm install
```

Open Visual Studio Project

```
Administrator: C:\Windows\System32\cmd.exe
Microsoft Windows [Version 10.0.14300]

```

# Running playground – old API

Open `src\PowerBIVisuals.sln`

In `src\Clients\PowerBIVisualsPlayground` select `standalone.html` as 'Set As Start Page'.

PowerBIVisualsPlayground → 'Property Pages' → 'Build' → 'Before running startup page' → 'No Build'.

PowerBIVisualsPlayground → 'Set as Startup Project'

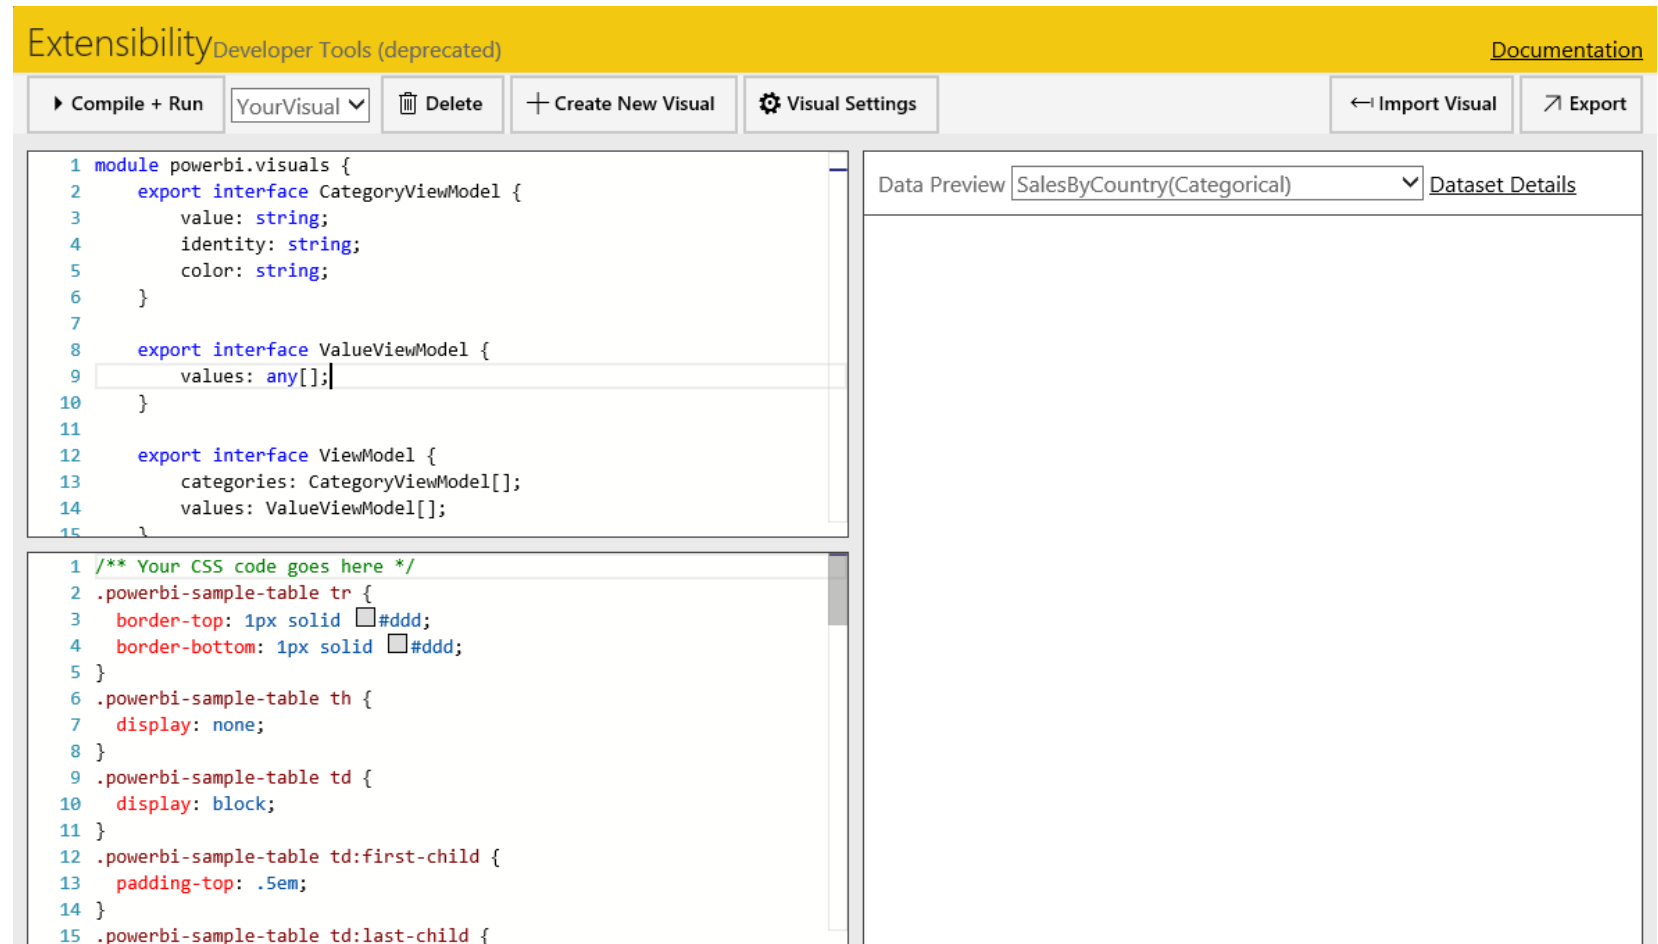

Run "build" task from "Task Runner Explorer" window.

**Ctrl + F5** to launch the Playground.

# Setting up the environment – web only API 1.0 (deprecated)

Enable dev tools on PowerBI.com

Try it out

# Three functions do the work

Init() – Sets up the visual when it is first created

Update() – Makes changes to view, data or style

Destroy() – Cleans up any remaining items when the visual is removed

Demo !!

# Important objects provided in IVisual

DataView : Object model used to store a representation of the data

DataRoles : What fields the visual expects

DataViewMappings : What the fields look like

Static converter pattern : maps the DataView to a D3-friendly  
ViewModel “data” object

# Setting up the environment - new

Install PowerBI visuals CLI tool - requires [NodeJS](#)

Install SSL certifications to enable live preview of visuals:

```
pbiviz --install-cert
```

Enable developer tools in PowerBI

Create new PowerBI Visual Project

```
pbiviz new <visualName>
```

Start development server

```
pbiviz start
```

Updating

Adding external libraries

Installing typing for Libraries

```
Windows PowerShell
aaaCustomViz> pbiviz start
info Building visual...
done build complete

info Starting server...
info Server listening on port 8080.
```

W

Cap

```
public enumerateObjectInstances(options: EnumerateVisualObjectInstancesOptions): VisualObjectInstanceEnumeration {
    let objectName = options.objectName;
    let objectEnumeration: VisualObjectInstance[] = [];

    switch(objectName) {
        case 'enableAxis':
            objectEnumeration.push({
                objectName: objectName,
                properties: {
                    show: this.barChartSettings.enableAxis.show,
                },

# *Walkthrough – building a bar chart*

Defining and Using visualTransform

Convert DataView into a view model

Adding color

```
function visualTransform(options: VisualUpdateOptions, host: IVisualHost): BarChartViewModel {
    let dataViews = options.dataViews;
    let defaultSettings: BarChartSettings = {

/**
 * Interface for BarChart data points.
 *
 * @interface
 * @property {number} value           - Data value for point.
 * @property {string} category        - Corresponding category of data value.
 * @property {string} color           - Color corresponding to data point.
 * @property {ISelectionId} selectionId - Id assigned to data point for cross filtering
 *                                     and visual interaction.
 */
interface BarChartDataPoint {
    value: number;
    category: string;
    color: string;
    selectionId: ISelectionId;
};
```

# *Walkthrough – building a bar chart*

Adding Selection and Interactions with Other Visuals

Adding Selection to Each Data Point

Assigning Selection Ids to Each Data Point

Interacting with your Data Points

```
let selectionManager = this.selectionManager;

//This must be an anonymous function instead of a lambda because
//d3 uses 'this' as the reference to the element that was clicked.
bars.on('click', function(d) {
  selectionManager.select(d.selectionId).then((ids: ISelectionId[]) => {
    bars.attr({
      'fill-opacity': ids.length > 0 ? BarChart.Config.transparentOpacity : BarChart.Config.solidOpacity
    });

    d3.select(this).attr({
      'fill-opacity': BarChart.Config.solidOpacity
    });
  });

  (<Event>d3.event).stopPropagation();
});
```

# Debugging

Using breakpoints

Showing Exceptions

Log exceptions

Break on exceptions

Edge

Chrome

```
public update(options: VisualUpdateOptions) {  
    console.log('Visual update', options);  
    debugger;  
    this.target.innerHTML = `<p>Update count: <em>${(this.updateCount++)}</em></p>`;  
}
```

```
module powerbi.extensibility.visual {  
    export function logExceptions(): MethodDecorator {  
        return function (target: Object, propertyKey: string, descriptor: TypedPropertyDescriptor<Function>)  
            : TypedPropertyDescriptor<Function> {  
  
            return {  
                value: function () {  
                    try {  
                        return descriptor.value.apply(this, arguments);  
                    } catch (e) {  
                        console.error(e);  
                        throw e;  
                    }  
                }  
            }  
        }  
    }  
}
```

```
@logExceptions()  
public update(options: VisualUpdateOptions) {
```
